

AI INTERACTION LOG - SPRINT 1

Task ID/Title: Frontend Styling and Development Assistance

Purpose of AI Use: UI/UX styling and assistance.

Prompt/Response: Asked the AI for help with specific details for the login and registration frontend, particularly with styling and making sure the pages appeared the way I wanted. I asked for assistance with some HTML, CSS, and JavaScript details when needed during development.

AI-Suggested Content: Suggestions for improving the visual appearance of the authentication pages, including layout, spacing, input styling, buttons, responsive design, and form-validation details.

Validation: Reviewed the suggestions manually and tested the pages locally using Live Server. I checked the appearance of the pages in the browser and tested the form behavior, including empty fields, invalid email addresses, password requirements, and password confirmation.

Decision: I selected and adjusted the suggestions that matched the frontend design and functionality I wanted for CareerConnect.

Reflection: AI was useful for getting help with specific frontend details and styling decisions. It also helped me troubleshoot individual issues while I remained responsible for reviewing, adapting, and testing the final frontend.

Responsible Person: Ahmed Yacine Meziani

Task ID/Title: Connect Registration Frontend to Backend API

Purpose of AI Use: Debugging, and API integration.

Prompt/Response: Asked the AI to help connect the registration page to the team's existing Node.js/Express registration endpoint. The AI reviewed the available `/api/auth/register` endpoint and suggested using the JavaScript `fetch()` API to send the user's email and password to the backend and handle success and error responses.

AI-Suggested Content: JavaScript code using `fetch()` with a POST request, JSON request data, backend error handling, loading-state management, and redirection to the login page after successful registration.

Validation: Started the Node.js server locally and tested the registration endpoint using curl. Then tested registration through the browser. Confirmed that a new user could register successfully and that attempting to register the same email again displayed the backend's duplicate-user error message.

Decision: The suggested integration was adapted to the existing frontend and backend code. The Full Name field remained frontend-only because the current backend registration endpoint accepts only email and password.

Reflection: I learned how the frontend communicates with an Express backend through HTTP requests and how backend status codes and messages can be displayed to the user.

Responsible Person: Ahmed Yacine Meziani

Task ID/Title: Debug Node.js and WSL Development Environment

Purpose of AI Use: Debugging and problem solving.

Prompt/Response: Asked the AI for help when the backend would not start correctly from the VS Code WSL terminal. The AI helped investigate the Node.js and npm paths and identified that Windows npm was interfering with the Ubuntu/WSL environment. It guided the installation and verification of Node.js and npm inside WSL.

AI-Suggested Content: Commands for checking Node.js/npm paths and versions, installing the Linux versions of Node.js and npm, installing project dependencies, and running the Express server directly with node server.js.

Validation: Verified that node and npm were available inside WSL, installed the required project dependencies, and successfully started the backend. Confirmed the server was running on `http://localhost:3000` and successfully tested the registration endpoint.

Decision: Accepted and modified during troubleshooting based on the results of each command.

Reflection: I learned that Windows and WSL can use different Node.js/npm installations and that checking executable paths is useful when debugging development-environment problems.

Responsible Person: Ahmed Yacine Meziani

Task ID/Title: Git and GitHub Feature Branch Workflow

Purpose of AI Use: GitHub guidance.

Prompt/Response: Asked the AI for guidance on safely working on the repository without affecting teammates' work.

AI-Suggested Content: Git commands and explanations for cloning the repository, working on feature/login-registration-frontend, committing changes, pushing to GitHub, creating PR #75, fetching updates, and merging updates from main.

Validation: Verified each operation using Git/GitHub. The login and registration changes were committed and pushed to feature/login-registration-frontend, and Pull Request #75 was successfully created and later updated with the registration API integration.

Decision: Commands were executed individually and their results were checked before proceeding.

Reflection: AI helped me better understand the difference between local changes, commits, branches, pushes, pull requests, and merging into main. Working step by step reduced the risk of accidentally modifying the team's shared branch.
