

AI INTERACTION LOG - SPRINT 1

Task ID/Title: Review Sprint 1 Backend Planning

Purpose of AI Use: Requirements analysis and planning.

Prompt/Response: Asked the AI to review the project brief and GitHub repository, identify missing Sprint 1 backend work, and help choose a task. It suggested building profile creation, viewing and editing for Issues #43, #46 and #47.

AI-Suggested Content: A profile feature as the second basic demonstration, with database and login dependencies identified.

Validation: Compared the suggestions with the assignment brief and GitHub issues. Checked that the repository had a registration API but lacked profile endpoints.

Decision: Modified before use. Selected the three profile API issues but initially implemented only a Sprint 1 prototype since the db was yet to be up to date.

Reflection: The review helped me choose a specific contribution and identify work that depended on teammates.

Responsible Person: Michael Theodore

Task ID/Title: Implement profile creation, viewing and updating (Issues #43, #46 and #47).

Purpose of AI Use: Code generation and implementation guidance.

Prompt/Response: Asked the AI to help build the profile feature using the current Node.js/Express server while the SQL database and login were not ready. It suggested an in-memory profiles array, validation, and POST /api/profile, GET /api/profile/me and PUT /api/profile/me routes.

AI-Suggested Content: Express route code and a temporary x-demo-user-id header to associate demo requests with a registered user.

Validation: Ran the server locally. Registered a user, created a profile, viewed it, updated the headline and viewed it again to confirm the change.

Decision: Accepted for the Sprint 1 prototype. Real authentication and SQL persistence remain pending; the issues have not been closed but will be very soon.

Reflection: I learned how route middleware, field validation and response codes fit together. The in-memory approach is suitable only for a temporary demo.

Responsible Person: Michael Theodore

Task ID/Title: Run and test the backend locally.

Purpose of AI Use: Troubleshooting and testing guidance.

Prompt/Response: Asked the AI about missing Git, Node.js and npm commands, a PowerShell script execution error, and how to test profile requests. It guided me through installing Git and Node.js, using npm.cmd, running the server, and testing with Invoke-RestMethod.

AI-Suggested Content: Commands for setting up the local environment and sending registration, create-profile, view-profile and update-profile requests.

Validation: Confirmed Node.js worked, npm.cmd installed dependencies, and the server ran on localhost:3000. Checked the returned profile and updated headline.

Decision: Accepted after running the commands and checking the results.

Reflection: I learned to keep the server running in one terminal and use another terminal to test its API.

Responsible Person: Michael Theodore
