

AI INTERACTION LOG – SPRINT 1

Title: Generate Sprint 1 User Stories.

Purpose of AI Use: Brainstorming

Chat Link: <https://share.gemini.google/qVGGFd6dokoC>

AI-Suggested Content: Generated 10 user stories for the platform features such as registration, resume management. 5 Additional user stories were generated that take inspiration from successful career seeking websites.

Validation: Reviewed the generated stories to match with project requirements to ensure that they meet the criteria for the scope of the project.

Reflection: The AI was helpful in this matter by providing task breakdown and acceptance criteria, which would aid in guiding us through on how to get started. This is especially useful as the group members don't have necessary relevant experience on using GitHub.

Title: Implement User Registration API Endpoint (Issue #25)

Purpose of AI Use: Code generation, environment setup troubleshooting, and debugging.

Prompt/Response: Prompts used: "How to make 1 simple feature in the backend for the website such as user login?", "Let's do Node.js with Express", plus troubleshooting prompts for Git and npm errors.

AI-Suggested Content: Provided step-by-step instructions to install Git and Node.js, bypassed Windows PowerShell execution policies, and generated the "server.js" boilerplate using Express and bcrypt to handle password hashing and duplicate email checks.

Validation: Tested the endpoint locally using the Thunder Client extension in VS Code. Confirmed the server returns a 201 Created for new users and a 409 Conflict when sending duplicate email payloads.

Reflection: The AI assistance was highly practical for quickly resolving local environment issues (missing Git/Node installations) and rapidly prototyping the Express server boilerplate without having to look up standard library documentation.
