

Sprint 1 AI Usage Log

Aymanek Mekkaoui | 40287951 | CareerConnect

1. README creation and revision

Date: September 24, 2026

Tool: OpenAI Codex

Responsible person: Aymanek Mekkaoui

Purpose: Documentation writing and editing for the Sprint 1 README.

AI-suggested content: AI drafted the README from the course brief, shortened it to the seven required sections following user feedback, and inserted team names and IDs from the supplied roster. This was drafting and editing assistance, not solely database advice.

Validation: The assistant compared the content with the supplied brief and roster, checked the Git diff, and confirmed successful pushes. Team review is still required.

Decision: Modified following user feedback and committed: fd89ca3, 0d75669, b32820d and 4c961ba.

Reflection: Personal reflection to be completed by Aymanek after reviewing and reproducing the work. No personal learning statement is attributed to him by the assistant.

Evidence appendix: prompts and relevant response excerpts

User prompt: write the README file, and push it to the repo

Relevant AI response: Updated and pushed the README to main. It covers the project, features, Sprint 1 scope, setup, and AI documentation requirements. Team members and undecided technologies are marked "To be confirmed."

User prompt: that's too much, the README should only contain this :

Relevant AI response: Shortened the README to only the seven requested sections and pushed it to main. Undecided details remain "To be confirmed."

User prompt: add the ID numbers

Relevant AI response: Added all six student IDs beside the names in the README and pushed to main.

The second prompt included an image listing: project description, identified problem, proposed solution, team members, technologies, setup instructions and proposed features. Roster source: the Google Sheet supplied in the conversation. Private link-tracking parameters are omitted.

2. Sprint 1 requirements and repository review

Date: October 1, 2026

Tool: OpenAI Codex

Responsible person: Aymane Mekkaoui

Purpose: Compare the assignment brief with GitHub progress and clarify outstanding work.

AI-suggested content: AI inspected files, issues, branches and pull requests. It identified incomplete planning, unassigned tasks, scattered AI logs, inconsistent role assignments, missing automated tests, and temporary in-memory data storage. It explained that database work and a personal AI report remained outstanding.

Validation: The assistant cross-checked findings against the provided DOCX and GitHub content. It did not run the application during that review. Ownership still needs team confirmation because the README and minutes conflict.

Decision: The user requested follow-up database implementation. Review findings are guidance; no claim that the team independently validated every finding.

Reflection: Personal reflection to be completed by Aymane after reviewing and reproducing the work. No personal learning statement is attributed to him by the assistant.

Evidence appendix: prompts and relevant response excerpts

User prompt: what do i need for sprint 1, check the github as well for coherence

Relevant AI response: Sprint 1 is partially ready. You have the README, 15 stories, a detailed task breakdown, and a workflow document. The biggest gaps are planning, assignments, AI evidence, and an integrated two-feature demo.

User prompt: is aymane's (me) job done for sprint 1

Relevant AI response: Not fully, based on what's recorded in GitHub.

3. Database implementation and setup

Date: October 1, 2026

Tool: OpenAI Codex

Responsible person: Aymanek Mekkaoui

Purpose: Complete the PostgreSQL portion of Sprint 1 and document how to run and verify it.

AI-suggested content: AI generated PostgreSQL migrations for users, profiles and resume metadata; node-postgres connection code; persistent registration/profile queries; Docker Compose configuration; integration tests and CI; setup/schema documentation; and this AI report. Existing demo authentication remains explicitly limited to local use.

Validation: The assistant ran the local integration suite successfully with pg-mem. Coverage includes repeat migrations, password hashing, normalized-email duplicates, profile persistence across app restart, validation, constraints and cascading deletion. Docker/PostgreSQL were unavailable locally. GitHub CI is configured to run the same suite against PostgreSQL 17; consult PR checks for the actual result. PDF pages were rendered for visual inspection. Human review and a local PostgreSQL demonstration remain pending.

Decision: Prepared for teammate review on feature/sprint1-database. Not yet independently validated or approved by Aymanek. This report records substantial implementation assistance accurately.

Reflection: Personal reflection to be completed by Aymanek after reviewing and reproducing the work. No personal learning statement is attributed to him by the assistant.

Evidence appendix: prompts and relevant response excerpts

User prompt: can you do it, and for the ai log mention i only used ai for light database assistance ?

Relevant AI response: I can finish the database work, update the setup instructions, and prepare your AI log. The log needs to reflect the actual help: I already wrote and revised the README, and completing the database would be substantial implementation assistance. I can keep the wording concise, but I can't accurately describe that as only light database assistance.

User prompt: ok, do it

Relevant AI response: I'll check the latest repository state and your assigned scope, complete the database work, and prepare a concise AI log that accurately records the assistance.

Generated implementation evidence is preserved in this branch: db/, server.js, compose.yaml, test/database.test.js, .github/workflows/database.yml and docs/database.md. The earlier prompts requested the phrase "light assistance"; the assistant declined to use it for substantial implementation work, and the user then authorized proceeding.
