AI INTERACTION LOG - SPRINT 2

Task ID/Title: Resume Management Frontend Development

Purpose of AI Use: Frontend development, UI/UX assistance, and validation.
Prompt/Response: Asked the AI for help with specific details for the resume frontend, particularly with the styling and making sure the pages appeared the way I wanted

AI-Suggested Content: HTML, CSS, and JavaScript for PDF selection, file-type and 5 MiB size validation, displaying the selected filename and size, removing a selection, and a responsive layout.

Validation: Reviewed the resume page locally using Live Server and checked the layout and file-selection behavior. Corrected a filename-wrapping issue. Actual backend resume upload, replacement, and retrieval were not tested because those endpoints were not implemented.

Decision: Kept the resume interface frontend-only. Committed the changes and submitted a pull request that was subsequently merged into main.

Reflection: AI helped break the task into manageable frontend changes and was useful for specific frontend details and styling decisions.

Responsible Person: Ahmed Yacine Meziani

Task ID/Title: User Profile Frontend Enhancements

Purpose of AI Use: Frontend development, UI/UX improvements, JavaScript assistance, and feature validation.

Prompt/Response: Asked the AI for help improving the existing My Profile page by proposing additional professional information sections. I wanted users to be able to enter more information about their education, work experience, professional links, and job preferences.

AI-Suggested Content: HTML, CSS, and JavaScript for six additional sections: About Me, Education, Profile Picture, LinkedIn/GitHub, Job Preferences, and Work Experience.

Validation: Tested the updated Profile page locally using Live Server. Verified that adding and removing work experience entries worked correctly. Reviewed the layout and identified a background issue at the bottom of the long page then verified that the issue was fixed later.

Decision: Kept the additional Profile sections frontend-end only because the corresponding backend functionality was not yet available. Preserved the existing profile-saving behavior. Committed the changes and created a pull request.

Reflection: AI helped me implement and improve several front-end components while keeping the existing Profile functionality intact. I learned the importance of testing changes visually.

Task ID/Title: Git and GitHub Commands and Pull Request Management

Purpose of AI Use: GitHub guidance, version control and troubleshooting.

Prompt/Response: Asked the AI for step-by-step assistance with Git commands because I wanted to correctly manage my changes and avoid mistakes when working in the team's shared repository. I requested help creating branches, checking modified files, staging changes, committing, pushing, and creating pull requests.

AI-Suggested Content: Git commands such as git status --short --branch, git switch main, git pull --ff-only origin main, git switch -c, git add, git diff --cached --stat, git commit, and git push -u origin. AI also explained the purpose of each command and helped me understand the difference between local commits, remote branches, pull requests, and merges.

Validation: Executed the commands individually in the VS Code terminal and checked the results before continuing. Verified the active branch, the list of modified files, the staged changes, and the GitHub pull request status. Confirmed that the Profile enhancements were pushed successfully and that the pull request checks passed.

Decision: Followed a step-by-step Git workflow instead of running several unfamiliar commands without verification. Used separate feature branches for my tasks and created pull requests to submit changes for review.

Reflection: AI helped me become more comfortable using Git and GitHub. I better understood how to safely save my work, share it with my teammates, and avoid accidentally committing unrelated files or changing the main branch.
