SOEN 341 Software Process
Sprint 3 Project Guidelines - Fall 2026
Project Title: CareerConnect - Job Search and Application Tracking Platform

1. General Information

- Weight: 5% of the overall course grade.
- Team scope: All members are expected to contribute to, and will be individually evaluated on, this sprint.

2. Introduction

For Sprint 3, teams must complete the remaining core functionality of the CareerConnect platform, strengthen software quality through testing, and implement the project's Generative AI requirement. Features completed during previous sprints should be refined, integrated, and fully tested. By the end of Sprint 3, each team must have implemented at least one Generative AI feature, either AI-Powered Resume Feedback, AI Job Matching Suggestions, or another TA-approved team-proposed AI feature.

3. Features for Sprint 3

1. Recruiter Dashboard and Posting Management: Recruiters can create, edit, archive, and manage their job postings from one place. Each posting shows the applications received, with filters (such as status or date) and the ability to review candidates and update their status.
2. Application Analytics and History Dashboard: Job seekers get a dashboard showing their application history, a breakdown of application status (pending, interview, rejected, etc.), and job-search activity metrics such as applications submitted over time.
3. Notifications and Reminders: Users receive in-app notifications for application updates, interview invitations, upcoming deadlines, and recruiter actions such as new applications.
4. AI feature *(start in Sprint 3, complete in Sprint 4)*:
   - AI-Powered Resume Feedback: Analyze uploaded resumes and provide AI-assisted recommendations.

- AI Job Matching Suggestions: Recommend relevant jobs based on user profiles and resumes.
- Team-proposed AI feature: An alternative idea, subject to TA approval.

4. Sprint 3 Delivery Instructions

- Maintain and update the project board, backlog, sprint plan, and task assignments.
- Create user stories and tasks for Sprint 3 features.
- Write at least one acceptance test for each Sprint 3 user story.
- Develop and implement Sprint 3 features.
- Create unit tests for all Sprint 3 features and run them automatically through CI.
- Maintain the CI pipeline.
- Upload all meeting minutes to the repository.
- Maintain detailed contribution logs.
- Maintain the AI Usage Log.
- Each team member must submit a Sprint 3 PDF report in their personal AI_Log subdirectory.
- Prepare a demonstration of Sprint 3 functionality.

5. AI Usage

You may use AI at different stages of the project, such as requirements elicitation, documentation, planning, testing, debugging, and implementation. The team must review, validate, and document all AI-generated content. You are not required to use AI for all project activities or deliverables.

During the Sprint 3 evaluation, teams must be prepared to present evidence of AI usage, including prompts, generated outputs, modifications, validation steps, and final decisions. Students should be able to explain both the technical and the AI-assisted decisions behind their work.

6. Submission Requirements

6.1. Sprint 3 Report Submission

Each team must submit a one-page Sprint 3 Summary Report highlighting the accomplishments of the sprint. The report should provide a concise overview of the team's progress and should not duplicate detailed information already available in the GitHub repository.

The report should include:

- Sprint Objectives: Briefly state the goals and planned outcomes of Sprint 3.
- Features and Functionality Implemented: Summarize the major features, modules, or components completed during the sprint.
- Team Innovation and Original Features: Describe the feature(s), ideas, or functionalities that make your project unique.
- Challenges and Resolutions: Briefly discuss any important challenges encountered and how they were addressed.
- Team Contributions: Provide a summary of how team members contributed to the sprint.
- Repository Reference: Include the GitHub repository link for reference.

6.2. GitHub Repository Evaluation

The Sprint 3 implementation will be evaluated during the laboratory session directly from the team's GitHub repository. Therefore, all Sprint 3 artifacts, including source code, issues, project board updates, meeting minutes, tests, AI usage logs, and CI/CD configurations, must be available and up to date in the repository before the evaluation.

Students may be asked to demonstrate implemented features, explain technical decisions, and discuss their individual contributions to the project.

7. Grading Scheme

Total: 100 points = 5% of the course grade

Category	Weight
Core Feature Development	**20**
Acceptance Tests	**20**
Continuous Integration Pipeline	**10**
Unit Testing	**20**
Meeting Minutes	**5**
Detailed Log of Each Team Member's Contribution	**5**
Project Management and GitHub Usage	**10**
Individual Contribution	**10**
TOTAL	**100**
